1. Introduction

ElectroGrid (EG) is the company in charge of the country's power system. They have a certain system which enables to monitor the customers' power consumption, generating monthly invoices and sending them to the users automatically, and accepting online payments from the users. Here, the functions of this system are executed by the RESTful architecture based on Java technologies such as JAX-RS and Jersey. Apparently, this support system is designed with the aim of increasing the scalability of EG's online platform in order to serve all the users.

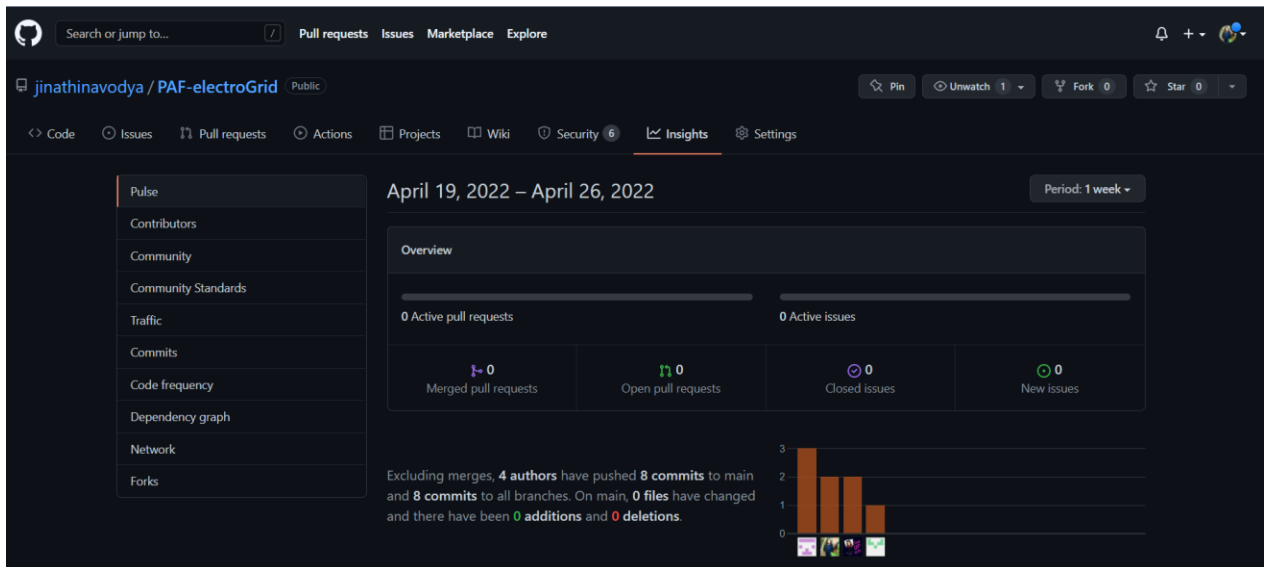

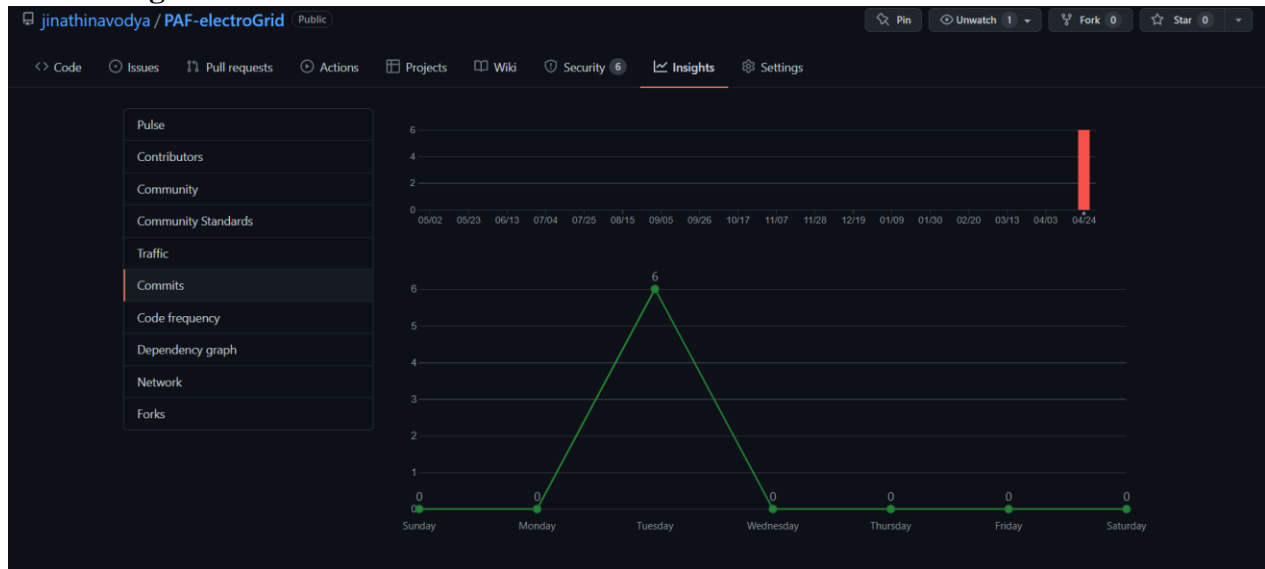

2. Workload Distribution

Student ID	Name	Service	Work allocated
IT20020958	Mayadunne J.N.A.	Auditing Service (Accounts)	Implementing all the services related for handling Accounts
IT20062392	Withana W.D.T.S.J.	Invoicing Service (Billing)	Implementing all the services related to billing procedure
IT20003128	Jayathilaka G.W.C.D.	Payment Service	Implementing all services related with paying process
IT20111724	Gunasekara H.M.D.P.K.	End-user Service	Implementing all the services related for user handling

3. Version control system

Commit log:

4. SE Methodology

Because there is no uncertainty in the behavior of the requirements, ElectroGrid's system architecture and implementation are closely tied to the waterfall development approach.

We collected stakeholder and customer requirements as the first phase in the waterfall technique. As a consequence of this process, we were able to have a better grasp of the project scope, and each team member was able to comprehend their role in the project and what it included. JAX-RS and Jersey, as well as Java, were used to create the system architecture. Based on the knowledge from the previous stage, each member of the group began developing the Electro grid system, and a superior product resulted. The implementation procedure is being followed.

We were able to simplify the difficult process of project development using the waterfall paradigm. We were able to construct the Electro Grid system without overlapping each phase since we used the waterfall methodology to design it.

5. Time Schedule (Gantt chart)

6. Requirements

8.1 Auditing Management (Accounting)

IT20020958 Mayadunne J.N.A.

GitHub – Auditing Service

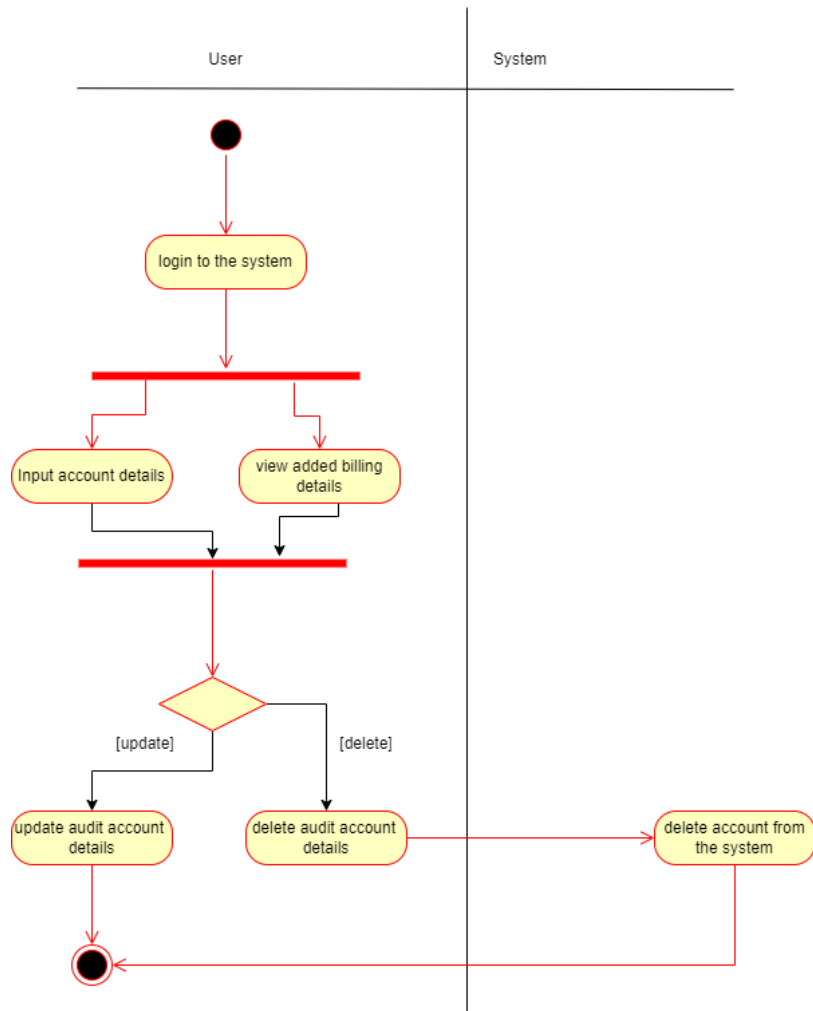

API Design Relational

Auditing management service is used to add new accounts in to the ElectroGrid (EG) System. In addition to that it facilitates update and delete the details of added accounts through the system. admin can view their profile and they can change any detail when they need. User has all the authentication for add, update, delete and view user details.

Tools Used

	Tool	Reason
Back End	JAX-RS, Jersey, Java	Easy configuration and popularity in the industry.
Server	Apache Tomcat 9.0	Comparatively highly secured
Database	MySQL+ workbench	Easily able to handle the Data Base
Build Tool	Maven	Simplifies the process of project building
IDE	Eclipse IDE (2020-12)	Great for handling larger projects and highly stabilized
Test Client	Postman	Easy creation of test suits

8.2 Invoice Management (billing)

IT20062392 - Withana W.D.T.S.J.

GitHub – Invoice Service

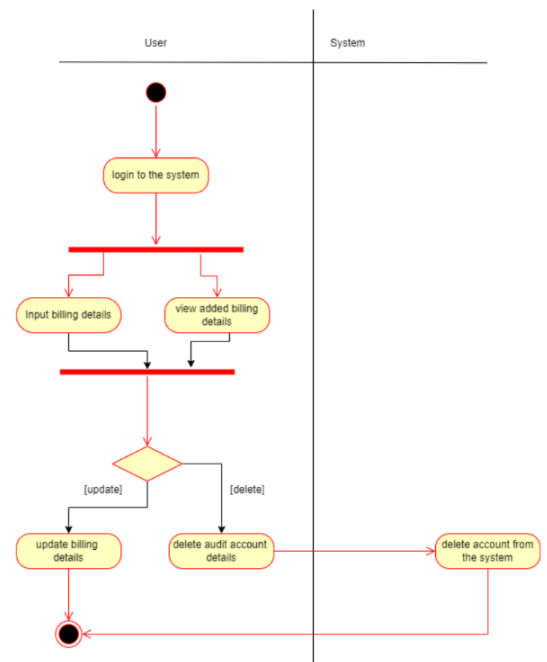

API Design Relational

Invoice management service is used to add new accounts in to the ElectroGrid (EG) System. In addition to that it facilitates update and delete the details of added invoices through the system. admin can view their profile and they can change any detail when they need.

8.4 User Management

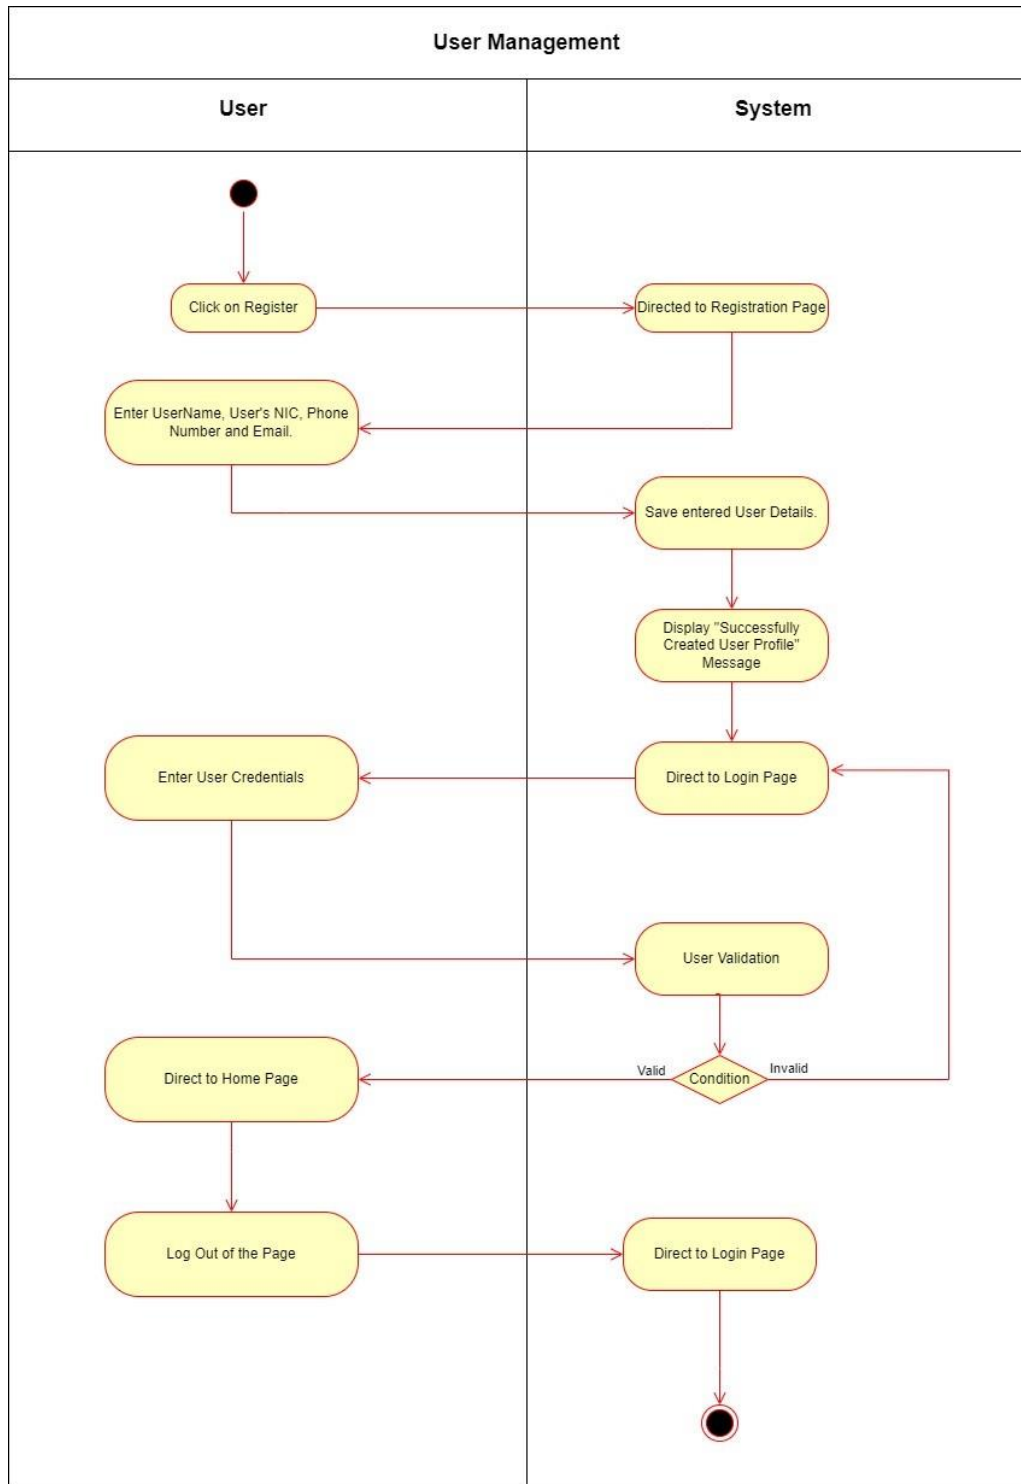

IT20111724 - Gunasekara H.M.D.P.K.

GitHub – User Service

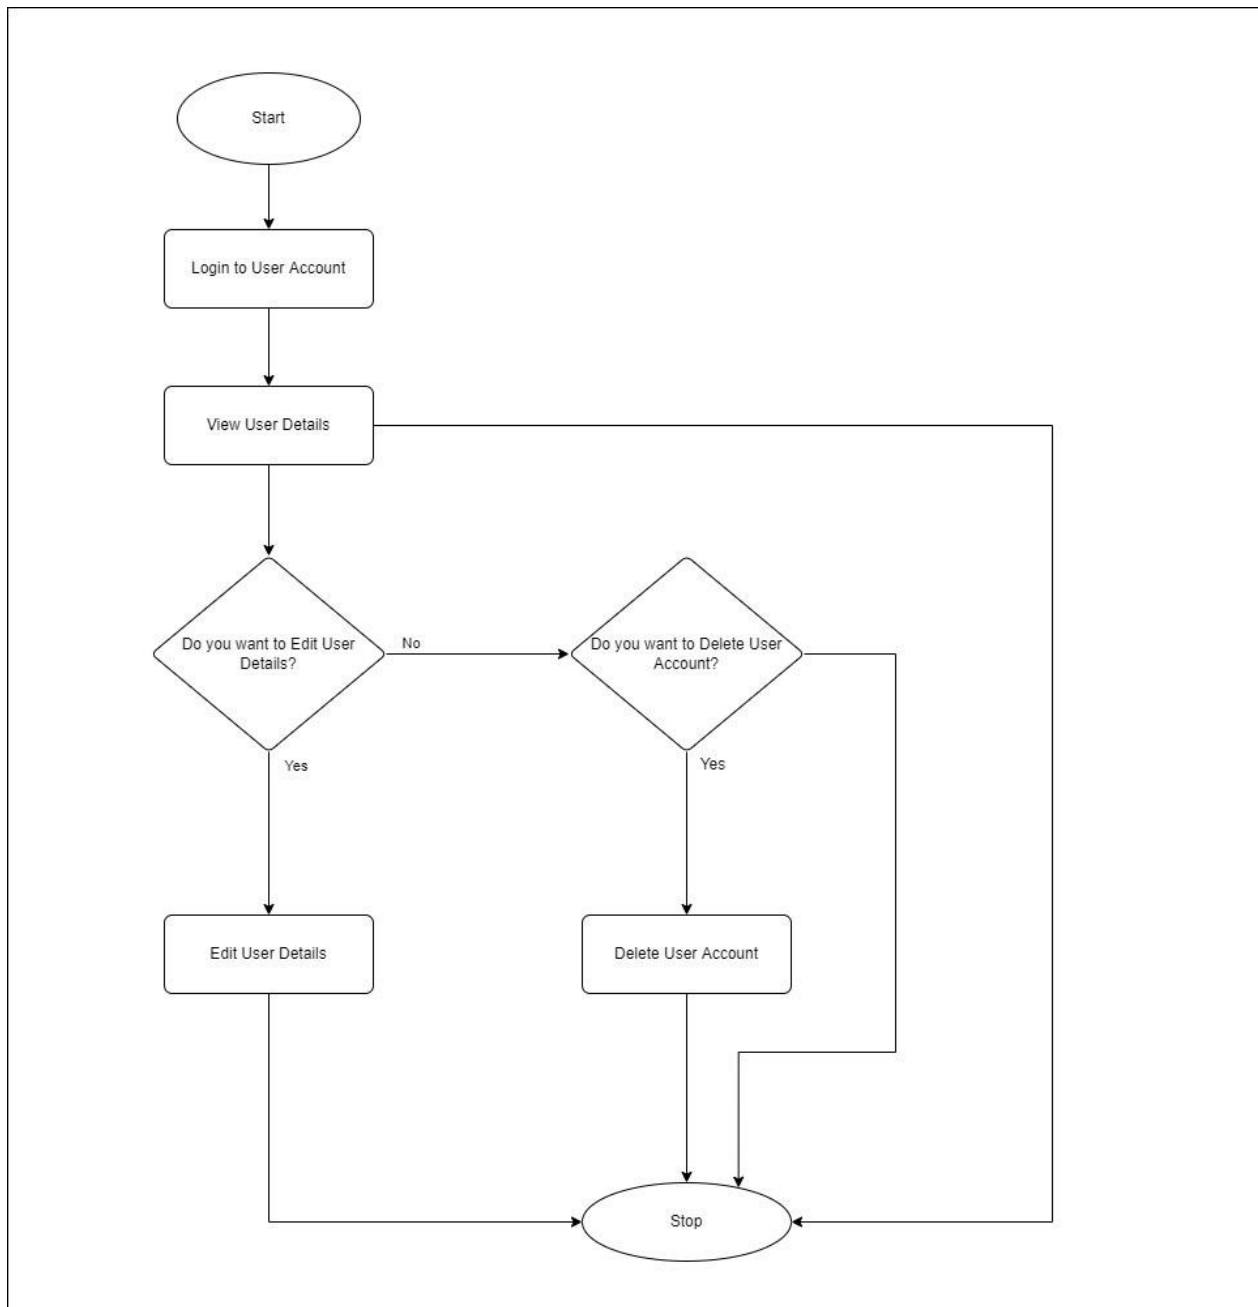

API Design Relational

In User Management Function If users want to update profile details they can update easily and if they want to delete accounts, they can also delete accounts from the system. an add user accounts to the system. User Management function is implemented as an API system that helps in the adding, updating, viewing and deleting the details regarding the users' details.

10.1.2 Test Results Screenshots -Postman

Get Request

The screenshot shows the Postman interface for a GET request. The URL bar displays `http://localhost:8086/paf_backend/AccountService/Accounts/`. The request method is set to GET. The 'Body' tab is selected, showing a message: 'This request does not have a body'. Below the request details, the 'Body' tab is active, showing a table with five columns: Account ID, City, Building Number, Total Amount To Pay, and User ID.

Account ID	City	Building Number	Total Amount To Pay	User ID
------------	------	-----------------	---------------------	---------

Put request
